# Using R and Bioconductor for proteomics data analysis

Laurent Gatto Computational Proteomics Unit

Version of this document: 39e04c5 [2014-11-23 16:33:35+0000]

### Setup

The follow packages will be used throughout this documents. R version 3.1.1 or higher is required to install all the packages using BiocInstaller::biocLite.

```
library("mzR")
library("mzID")
library("MSnID")
library("MSGFplus")
library("MSnbase")
library("rpx")
library("MLInterfaces")
library("pRoloc")
library("pRolocdata")
library("rTANDEM")
```

## Error in library("rTANDEM"): there is no package called 'rTANDEM'

```
library("MSGFplus")
library("MSGFgui")
```

## Error in library("MSGFgui"): there is no package called 'MSGFgui'

```
library("rols")
library("hpar")
```

The most convenient way to install all the tutorials requirement (and more related content), is to install RforProteomics with all its dependencies.

```
library("BiocInstaller")
biocLite("RforProteomics", dependencies = TRUE)
```

#### Introduction

This tutorial illustrates R / Bioconductor infrastructure for proteomics. Topics covered focus on support for open community-driven formats for raw data and identification results, packages for peptide-spectrum matching, data processing and analysis:

- Exploring available infrastructure
- Mass spectrometry data
- Getting data from proteomics repositories
- Handling raw MS data

- Handling identification data
- MS/MS database search
- Analysing search results
- High-level data interface
- Quantitative proteomics
- Importing third-party quantitative data
- Data processing and analysis
- Statistical analysis
- Machine learning
- Annotation
- Other relevant packages/pipelines

Links to other packages and references are also documented. In particular, the vignettes included in the RforProteomics package also contains relevant material.

### Exploring available infrastructure

In Bioconductor version 3.1, there are respectively 66 proteomics, 44 mass spectrometry software packages and 7 mass spectrometry experiment packages. These respective packages can be extracted with the proteomicsPackages(), massSpectrometryPackages() and massSpectrometryDataPackages() and explored interactively.

```
library("RforProteomics")
pp <- proteomicsPackages()
display(pp)</pre>
```

# Mass spectrometry data

Type	Format	Package
raw	mzML, mzXML, netCDF, mzData	mzR (read)
identification	mzIdentML	${\tt mzR} \ {\rm and} \ {\tt mzID} \ ({\rm read})$
quantitation	mzQuantML	
peak lists	mgf	MSnbase (read/write)
other	mzTab	${\tt MSnbase} \ ({\rm read/write})$

### Getting data from proteomics repositories

Contemporary MS-based proteomics data is disseminated through the ProteomeXchange infrastructure, which centrally coordinates submission, storage and dissemination through multiple data repositories, such as the PRIDE data base at the EBI for MS/MS experiments, PASSEL at the ISB for SRM data and the MassIVE resource. The rpx is an interface to ProteomeXchange and provides a basic and unified access to PX data.

```
library("rpx")
pxannounced()
```

## 15 new ProteomeXchange annoucements

```

```

Using the unique PXD000001 identifier, we can retrieve the relevant metadata that will be stored in a PXDataset object. The names of the files available in this data can be retrieved with the pxfiles accessor function.

```
px <- PXDataset("PXD000001")</pre>
рх
## Object of class "PXDataset"
## Id: PXD000001 with 8 files
## [1] 'F063721.dat' ... [8] 'erwinia_carotovora.fasta'
## Use 'pxfiles(.)' to see all files.
pxfiles(px)
## [1] "F063721.dat"
## [2] "F063721.dat-mztab.txt"
## [3] "PRIDE_Exp_Complete_Ac_22134.xml.gz"
## [4] "PRIDE_Exp_mzData_Ac_22134.xml.gz"
## [5] "PXD000001_mztab.txt"
## [6] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML"
## [7] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.raw"
## [8] "erwinia carotovora.fasta"
Other metadata for the px dataset:
pxtax(px)
## [1] "Erwinia carotovora"
pxurl(px)
```

## [1] "ftp://ftp.pride.ebi.ac.uk/pride/data/archive/2012/03/PXD000001"

```
pxref(px)
```

## [1] "Gatto L, Christoforou A. Using R and Bioconductor for proteomics data analysis. Biochim Biophys

Data files can then be downloaded with the pxget function. Below, we retrieve the sixth file, TMT\_Erwinia\_1uLSike\_Top10HCD\_isol2\_45stepped\_60min\_01.mzXML. The file is downloaded in the working directory and the name of the file is return by the function and stored in the mzf variable for later use

```
mzf <- pxget(px, pxfiles(px)[6])

## Downloading 1 file
## TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML already present.

```

### Handling raw MS data

The mzR package provides an interface to the proteowizard C/C++ code base to access various raw data files, such as mzML, mzXML, netCDF, and mzData. The data is accessed on-disk, i.e it is not loaded entirely in memory by default but only when explicitly requested. The three main functions are openMSfile to create a file handle to a raw data file, header to extract metadata about the spectra contained in the file and peaks to extract one or multiple spectra of interest. Other functions such as instrumentInfo, or runInfo can be used to gather general information about a run.

Below, we access the raw data file downloaded in the previous section and open a file handle that will allow us to extract data and metadata of interest.

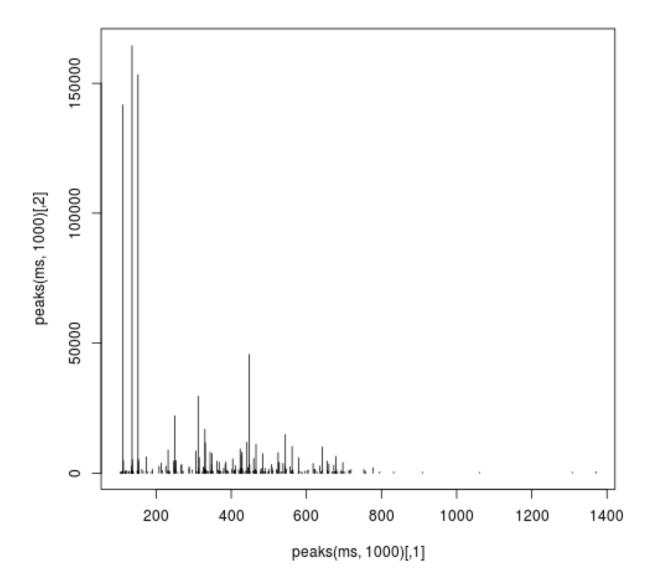

```
library("mzR")
ms <- openMSfile(mzf)</pre>
## Mass Spectrometry file handle.
## Filename: TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML
## Number of scans: 7534
hd <- header(ms)
dim(hd)
## [1] 7534
              21
names (hd)
##
    [1] "seqNum"
                                     "acquisitionNum"
    [3] "msLevel"
##
                                     "polarity"
   [5] "peaksCount"
                                     "totIonCurrent"
##
```

```
##
    [7] "retentionTime"
                                    "basePeakMZ"
   [9] "basePeakIntensity"
##
                                    "collisionEnergy"
## [11] "ionisationEnergy"
                                    "lowMZ"
## [13] "highMZ"
                                    "precursorScanNum"
                                    "precursorCharge"
  [15] "precursorMZ"
  [17] "precursorIntensity"
                                    "mergedScan"
## [19] "mergedResultScanNum"
                                    "mergedResultStartScanNum"
## [21] "mergedResultEndScanNum"
```

We can extract metadata and scan data for scan 1000 as follows:

```
hd[1000, ]
```

```
\verb|seqNum| acquisitionNum| \verb|msLevel| polarity| peaksCount| totIonCurrent|
## 1000

# Acquisition 100

#### Exercise

Read the MSnbase::MSmap manual and look at the example to learn how the mzR raw data support can be exploited to generate maps of slides of raw MS data. (Note that the hd variable containing the raw data header was missing in MSnbase version < 1.14.1.)

Solution Below we reproduce the example from the MSmap function from the MSnbase package to plot a specific slice of the raw data using the mzR functions we have just described.

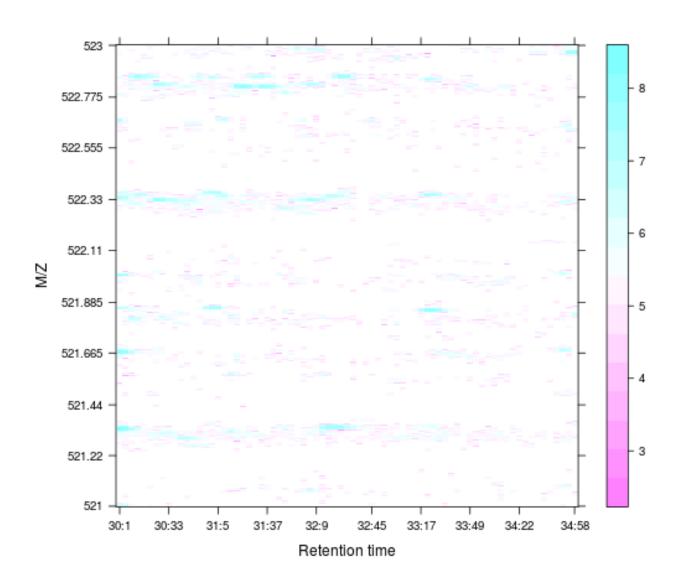

```
## a set of spectra of interest: MS1 spectra eluted
## between 30 and 35 minutes retention time
ms1 <- which(hd$msLevel == 1)</pre>
```

```
rtsel <- hd$retentionTime[ms1] / 60 > 30 &
    hd$retentionTime[ms1] / 60 < 35

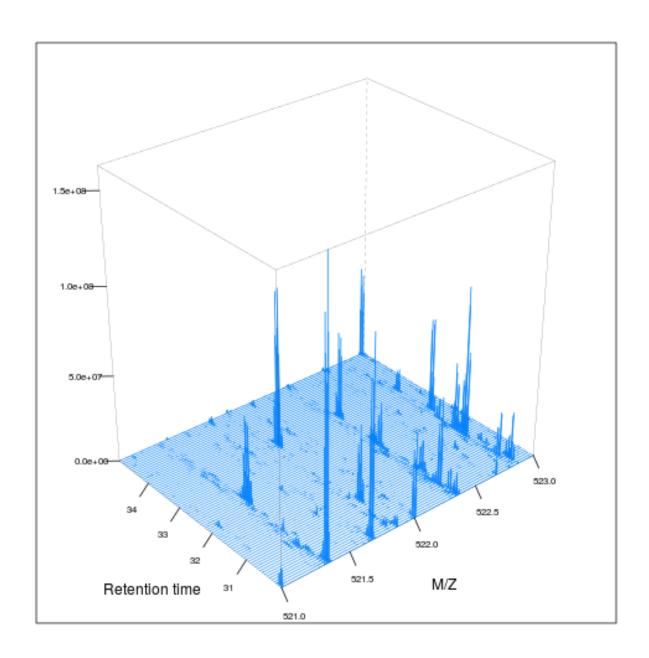

## the map
M <- MSmap(ms, ms1[rtsel], 521, 523, .005, hd)</pre>
```

## 1

```
plot(M, aspect = 1, allTicks = FALSE)
```

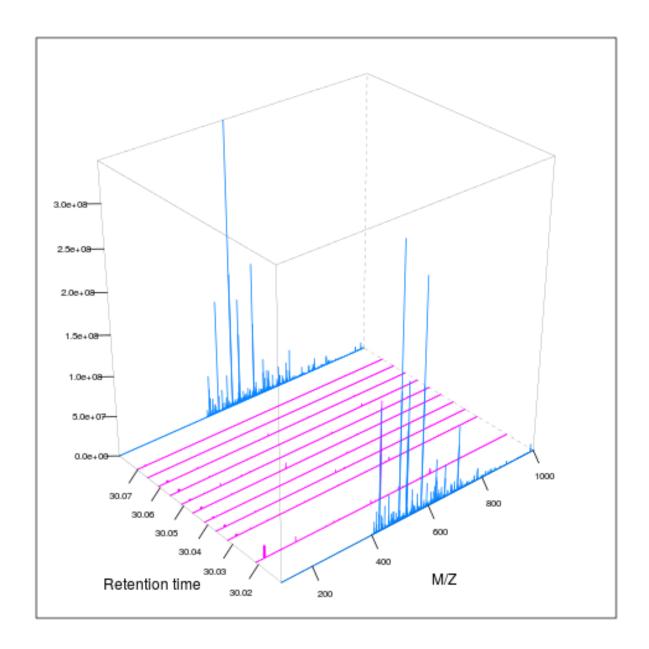

# plot3D(M)

```
## With some MS2 spectra
i <- ms1[which(rtsel)][1]
j <- ms1[which(rtsel)][2]
M2 <- MSmap(ms, i:j, 100, 1000, 1, hd)</pre>
```

# ## 1

# plot3D(M2)

# Handling identification data

The RforProteomics package distributes a small identification result file (see ?TMT\_Erwinia\_1uLSike\_Top10HCD\_isol2\_45ste that we load and parse using infrastructure from the mzID package.

## [1] "TMT\_Erwinia.mzid"

```
id <- mzID(f)

## reading TMT_Erwinia.mzid... DONE!

id

## An mzID object

##

## Software used: MS-GF+ (version: Beta (v10072))

##

## Rawfile: /home/lgatto/dev/00_github/RforProteomics/sandbox/TMT_Erwinia_1uLSike_Top10HCD_isol

##

## Database: /home/lgatto/dev/00_github/RforProteomics/sandbox/erwinia_carotovora.fasta

##

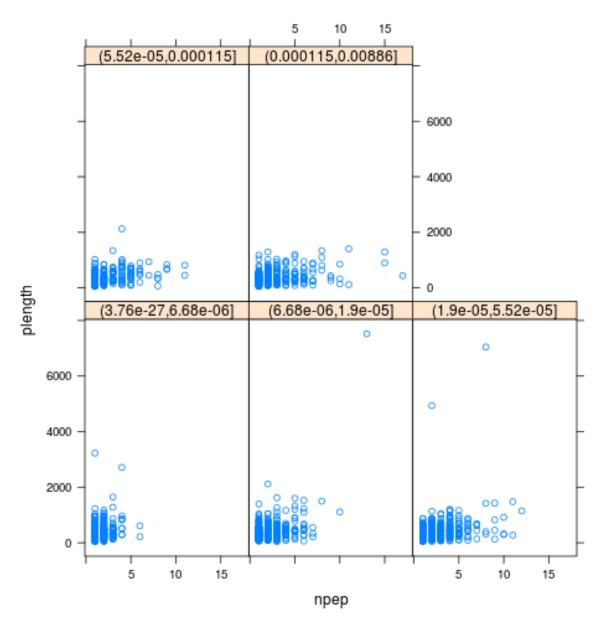

## Number of scans: 5287

## Number of PSM's: 5563</pre>
```

Various data can be extracted from the mzID object, using one the accessor functions such as database, scans, peptides, ... The object can also be converted into a data.frame using the flatten function.

#### Exercise

Is there a relation between the length of a protein and the number of identified peptides, conditioned by the (average) e-value of the identifications?

### Solution

# Exercise

The mzR package also support fast parsing of mzIdentML files with the openIDfile function. Compare it, it terms of output and speed with mzID.

```
system.time({
   id0 <- mzID(f)
   fid0 <- flatten(id0)
})</pre>
```

#### Solution

```
## reading TMT_Erwinia.mzid... DONE!
## user system elapsed
## 17.998 0.076 18.115
```

#### head(fid0)

```
spectrumid scan number(s) acquisitionnum passthreshold rank

### MS/MS database search

While searches are generally performed using third-party software independently of R or can be started from R using a system call, the rtandem package allows one to execute such searches using the X!Tandem engine. The shinytandem provides a interactive interface to explore the search results.

```
library("rTANDEM")
?rtandem
library("shinyTANDEM")
?shinyTANDEM
```

Similarly, the MSGFplus package enables to perform a search using the MSGF+ engine, as illustrated below:

A graphical interface to perform the search the data and explore the results is also available:

```
library("MSGFgui")
MSGFgui()
```

#### Exercise

Search TMT\_Erwinia\_1uLSike\_Top10HCD\_isol2\_45stepped\_60min\_01.mzXML against the fasta file from PXD000001 using, for example, MSGFplus/MSGFgui.

#### Solution

1. Get the fasta database:

```
fas <- pxget(px, pxfiles(px)[8])

## Downloading 1 file
## erwinia_carotovora.fasta already present.

basename(fas)

## [1] "erwinia_carotovora.fasta"</pre>
```

2. One could run MSGF+ from the command-line directly from R:

```
msgf <- system.file(package = "MSGFplus", "MSGFPlus", "MSGFPlus.jar")
system(paste0("java -jar ", msgf))
cmd <- paste("java -jar", msgf, "-protocol 2 -inst 1 -s", mzf, "-d", fas)
cmd</pre>
```

## [1] "java -jar /home/lg390/R/x86\_64-unknown-linux-gnu-library/3.2/MSGFplus/MSGFPlus/MSGFPlus.jar -pr

```
system(cmd)
```

3. Use MSGFplus:

(Note that in the runMSGF call above, I explicitly reduce the memory allocated to the java virtual machine to 3.5GB. In general, there is no need to specify this argument, unless you experience an error regarding the maximum heap size).

4. Through the graphical user interface:

```
library("MSGFgui")
MSGFgui()
```

### Analysing search results

The MSnID package can be used for post-search filtering of MS/MS identifications. One starts with the construction of an MSnID object that is populated with identification results that can be imported from a data.frame or from mzIdenML files.

```
library("MSnID")
msnid <- MSnID(".")</pre>
```

```
## Note, the anticipated/suggested columns in the
## peptide-to-spectrum matching results are:
## ------
## accession
## calculatedMassToCharge
## chargeState
## experimentalMassToCharge
## isDecoy
## peptide
## spectrumFile
## spectrumID
```

```
msnid <- read_mzIDs(msnid,
                      "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzid")
## Error: all(sapply(mzids, file.exists)) is not TRUE
show(msnid)
## MSnID object
## Working directory: "."
## #Spectrum Files: 0
The package then enables to define, optimise and apply filtering based for example on missed cleavages,
identification scores, precursor mass errors, etc. and assess PSM, peptide and protein FDR levels. Below, we
start by apply a correction of monoisotopic peaks (see ?correct_peak_selection for details) and define
two variables to be used for identification filtering.
msnid <- correct_peak_selection(msnid)</pre>
msnid$msmsScore <- -log10(msnid$`MS-GF:SpecEValue`)
## Error in log10(msnid$`MS-GF:SpecEValue`): non-numeric argument to mathematical function
msnid$absParentMassErrorPPM <- abs(mass_measurement_error(msnid))</pre>
As shown below, this particular spiked-in data set displays few high scoring non-decoy hits
## Error in UseMethod("densityplot"): no applicable method for 'densityplot' applied to an object of cl
We define a filter object, assigning arbitrary threshold and evaluate it on the msnid data
filt0bj <- MSnIDFilter(msnid)</pre>
filtObj$absParentMassErrorPPM <- list(comparison="<", threshold=5.0)</pre>
filtObj$msmsScore <- list(comparison=">", threshold=8.0)
## Error in `$<-`(`*tmp*`, "msmsScore", value = structure(list(comparison = ">", : msmsScore is not a v
## See parameter names method for MSnID object.
## Valid names are:
## experimentalMassToCharge
## absParentMassErrorPPM
filt0bj
## MSnIDFilter object
## (absParentMassErrorPPM < 5)</pre>
evaluate_filter(msnid, filt0bj)
```

We can also optimise the filtering with a target protein FDR value of 0.01

## Error: is.logical(object@psms\$isDecoy) is not TRUE

The resulting data can be exported to a data.frame or to a dedicated MSnSet data structure for quantitative MS data, described below, and further processed and analyses using appropriate statistical tests.

## High-level data interface

## #Spectrum Files: 0

The above sections introduced low-level interfaces to raw and identification results. The MSnbase package provides abstractions for raw data through the MSnExp class and containers for quantification data via the MSnSet class. Both store

- 1. the actual assay data (spectra or quantitation matrix), accessed with spectra (or the [, [[ operators) or exprs;
- 2. sample metadata, accessed as a data.frame with pData;
- 3. feature metadata, accessed as a data.frame with fData.

The figure below give a schematics of an MSnSet instance and the relation between the assay data and the respective feature and sample metadata.

Another useful slot is processingData, accessed with processingData(.), that records all the processing that objects have undergone since their creation (see examples below).

The readMSData will parse the raw data, extract the MS2 spectra (by default) and construct an MS experiment object of class MSnExp.

(Note that while readMSData supports MS1 data, this is currently not convenient as all the data is read into memory.)

```
library("MSnbase")
rawFile <- dir(system.file(package = "MSnbase", dir = "extdata"),</pre>
               full.name = TRUE, pattern = "mzXML$")
basename(rawFile)
## [1] "dummyiTRAQ.mzXML"
msexp <- readMSData(rawFile, verbose = FALSE)</pre>

```

The readMSData and addIdentificationData make use of mzR and mzID packages to access the raw and identification data.

Spectra and (parts of) experiments can be extraced and plotted.

## Quantitative proteomics

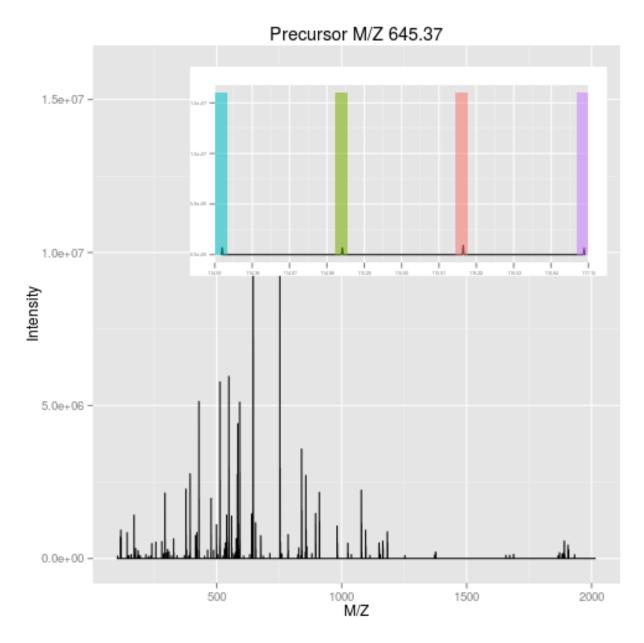

There are a wide range of proteomics quantitation techniques that can broadly be classified as labelled vs. label-free, depending whether the features are labelled prior the MS acquisition and the MS level at which quantitation is inferred, namely MS1 or MS2.

	Label-free	Labelled
MS1	XIC	SILAC, 15N
MS2	Counting	iTRAQ, TMT

In terms of raw data quantitation, most efforts have been devoted to MS2-level quantitation. Label-free XIC quantitation has however been addressed in the frame of metabolomics data processing by the xcms infrastructure.

An MSnExp is converted to an MSnSet by the quantitation method. Below, we use the iTRAQ 4-plex isobaric tagging strategy (defined by the iTRAQ4 parameter; other tags are available).

```
plot(msexp[[1]], full=TRUE, reporters = iTRAQ4)
```

```
msset <- quantify(msexp, method = "trap", reporters = iTRAQ4, verbose=FALSE)
exprs(msset)</pre>
```

```

```

Other MS2 quantitation methods available in quantify include the (normalised) spectral index SI and (normalised) spectral abundance factor SAF or simply a simple count method.

Note that spectra that have not been assigned any peptide (NA) or that match non-unique peptides (npsm > 1) are discarded in the counting process.

See also The isobar package supports quantitation from centroided mgf peak lists or its own tab-separated files that can be generated from Mascot and Phenyx vendor files.

Have a look at the **?quantify** documentation file and review the above by walking through the example.

### Importing third-party quantitation data

The PSI mzTab file format is aimed at providing a simpler (than XML formats) and more accessible file format to the wider community. It is composed of a key-value metadata section and peptide/protein/small molecule tabular sections.

```
mztf <- pxget(px, pxfiles(px)[2])

## Downloading 1 file
## F063721.dat-mztab.txt already present.

(mzt <- readMzTabData(mztf, what = "PEP"))

## Warning in readMzTabData(mztf, what = "PEP"): Support for mzTab version
## 0.9 only. Support will be added soon.

## Detected a metadata section
## Detected a peptide section</pre>
```

```
## MSnSet (storageMode: lockedEnvironment)

It is also possible to import arbitrary spreadsheets as MSnSet objects into R with the readMSnSet2 function.
The main 2 arguments of the function are (1) a text-based spreadsheet and (2) column names of indices that
identify the quantitation data.
csv <- dir(system.file ("extdata" , package = "pRolocdata"),</pre>
           full.names = TRUE, pattern = "pr800866n_si_004-rep1.csv")
getEcols(csv, split = ",")

## Data processing and analysis

#### Raw data processing

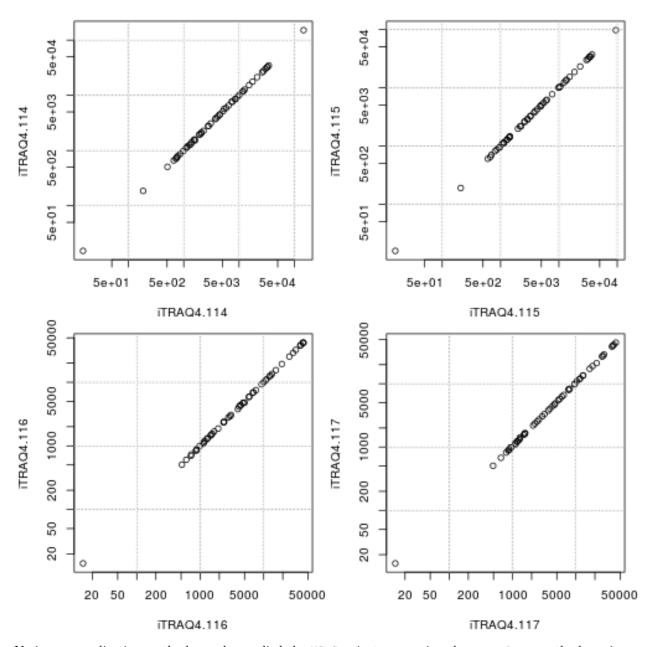

For raw data processing look at MSnbases's clean, smooth, pickPeaks, removePeaks and trimMz for MSnExp and spectra processing methods.

The MALDIquant and xcms packages also features a wide range of raw data processing methods on their own ad hoc data instance types.

#### Processing and normalisation

Each different types of quantitative data will require their own pre-processing and normalisation steps. Both isobar and MSnbase allow to correct for isobaric tag impurities normalise the quantitative data.

```
## - - Processing information - - -
## Data loaded: Wed May 11 18:54:39 2011
## iTRAQ4 quantification by trapezoidation: Thu Dec 4 18:47:54 2014
## Purity corrected: Thu Dec 4 18:47:54 2014
## MSnbase version: 1.1.22
```

Various normalisation methods can be applied the MSnSet instances using the normalise method: variance stabilisation (vsn), quantile (quantiles), median or mean centring (center.media or center.mean), ...

```
qnt.crct.nrm <- normalise(qnt.crct, "quantiles")
plot0(qnt, qnt.crct.nrm)</pre>
```

The combineFeatures method combines spectra/peptides quantitation values into protein data. The grouping is defined by the groupBy parameter, which is generally taken from the feature metadata (protein accessions, for example).

```
## arbitraty grouping
g <- factor(c(rep(1, 25), rep(2, 15), rep(3, 15)))
prt <- combineFeatures(qnt.crct.nrm, groupBy = g, fun = "sum")</pre>
```

```
processingData(prt)
```

```
## - - - Processing information - - -
## Data loaded: Wed May 11 18:54:39 2011
## iTRAQ4 quantification by trapezoidation: Thu Dec 4 18:47:54 2014
## Purity corrected: Thu Dec 4 18:47:54 2014
## Normalised (quantiles): Thu Dec 4 18:47:54 2014
## Combined 55 features into 3 using sum: Thu Dec 4 18:47:54 2014
## MSnbase version: 1.1.22
```

Finally, proteomics data analysis is generally hampered by missing values. Missing data imputation is a sensitive operation whose success will be guided by many factors, such as degree and (non-)random nature of the missingness. Missing value in MSnSet instances can be filtered out and imputed using the filterNA and impute functions.

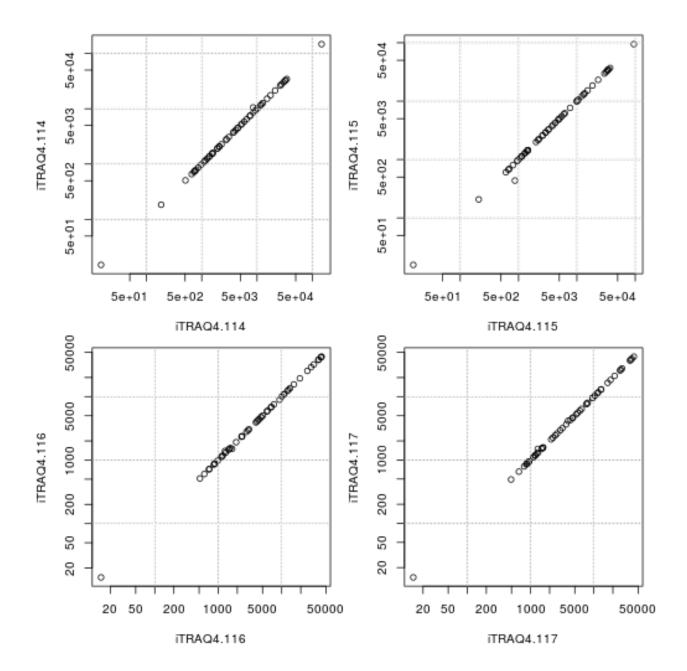

```
set.seed(1)
qnt0 <- qnt
exprs(qnt0)[sample(prod(dim(qnt0)), 10)] <- NA
table(is.na(qnt0))

##
## FALSE TRUE
## 209 11

qnt00 <- filterNA(qnt0)
dim(qnt00)

## [1] 44 4

qnt.imp <- impute(qnt0)
plot0(qnt, qnt.imp)</pre>
```

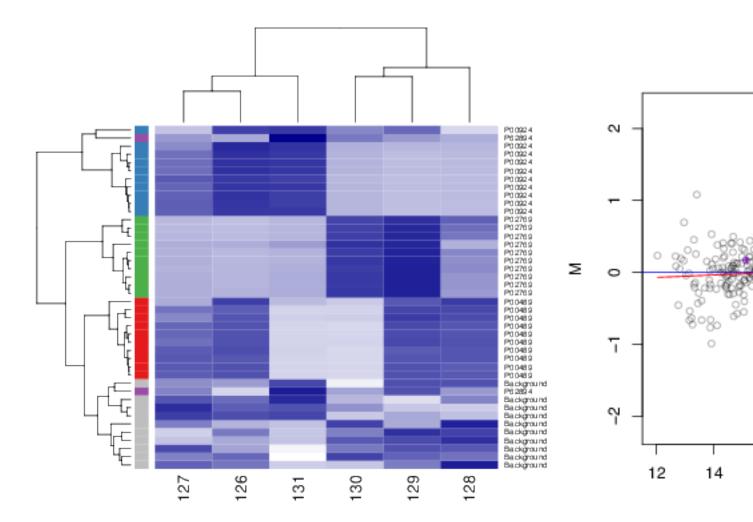

#### Exercise

The mzt instance created from the mzTab file has the following is a TMT 6-plex with the following design:

In this TMT 6-plex experiment, four exogenous proteins were spiked into an equimolar *Erwinia* carotovora lysate with varying proportions in each channel of quantitation; yeast enolase (ENO) at 10:5:2.5:12.5:10, bovine serum albumin (BSA) at 1:2.5:5:10:5:1, rabbit glycogen phosphory-lase (PHO) at 2:2:2:2:1:1 and bovin cytochrome C (CYT) at 1:1:1:1:1:2. Proteins were then digested, differentially labelled with TMT reagents, fractionated by reverse phase nanoflow UPLC (nanoACQUITY, Waters), and analysed on an LTQ Orbitrap Velos mass spectrometer (Thermo Scientic).

Explore the mzt data using some of the illustrated functions. The heatmap and MAplot (see

Maplot function), taken from the RforProteomics vignette, have been produced using the same data.

## Statistical analysis

R in general and Bioconductor in particular are well suited for the statistical analysis of data. Several packages provide dedicated resources for proteomics data:

- MSstats: A set of tools for statistical relative protein significance analysis in DDA, SRM and DIA experiments.
- msmsTest: Statistical tests for label-free LC-MS/MS data by spectral counts, to discover differentially expressed proteins between two biological conditions. Three tests are available: Poisson GLM regression, quasi-likelihood GLM regression, and the negative binomial of the edgeR package.

```

• isobar also provides dedicated infrastructure for the statistical analysis of isobaric data.

## Machine learning

The MLInterfaces package provides a unified interface to a wide range of machine learning algorithms. Initially developed for microarray and ExpressionSet instances, the pRoloc package enables application of these algorithms to MSnSet data.

#### Classification

The example below uses knn with the 5 closest neighbours as an illustration to classify proteins of unknown sub-cellular localisation to one of 9 possible organelles.

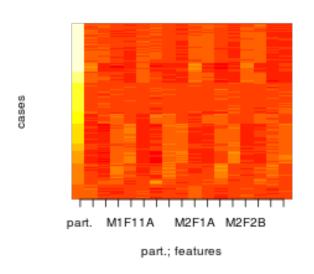

```
library("MLInterfaces")
library("pRoloc")
library("pRolocdata")
data(dunkley2006)
traininds <- which(fData(dunkley2006)$markers != "unknown")
ans <- MLearn(markers ~ ., data = t(dunkley2006), knnI(k = 5), traininds)
ans
## MLInterfaces classification output container
## The call was:
## MLearn(formula = markers ~ ., data = t(dunkley2006), .method = knnI(k = 5),
##
       trainInd = traininds)
## Predicted outcome distribution for test set:
##
                   ER membrane
##
        ER lumen
                                       Golgi Mitochondrion
                                                                  Plastid
               5
                                          67
                                                                       29
##

                                                         10
## Summary of scores on test set (use testScores() method for details):
      Min. 1st Qu. Median
                                              Max.
##
                              Mean 3rd Qu.
   0.4000 1.0000 1.0000 0.9332 1.0000 1.0000
```

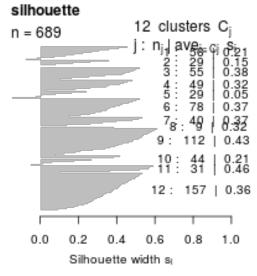

### Clustering

```
kcl <- MLearn( ~ ., data = dunkley2006, kmeansI, centers = 12)
kcl</pre>
```

#### kmeans

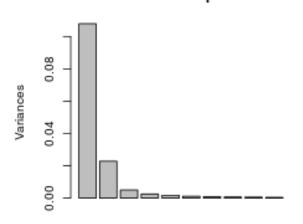

```
## clusteringOutput: partition table
##
## 1 2 3 4 5 6 7 8 9 10 11 12
## 56 29 55 49 29 78 40 9 112 44 31 157
## The call that created this object was:
## MLearn(formula = ~., data = dunkley2006, .method = kmeansI, centers = 12)
plot(kcl, exprs(dunkley2006))
```

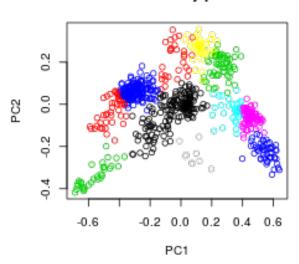

Average silhouette width: 0.33

# PCA screeplot

# PCA colored by partition

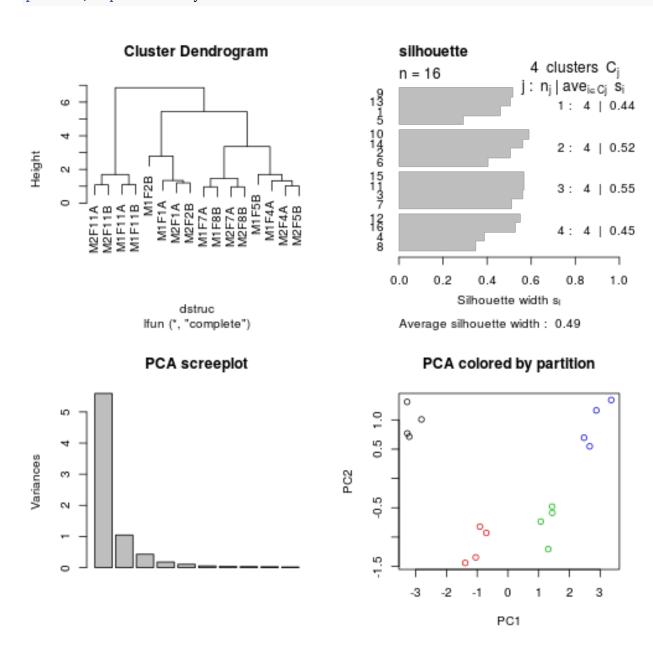

```
hcl <- MLearn( ~ ., data = t(dunkley2006), hclustI(distFun = dist, cutParm = list(k = 4)))
hcl</pre>
```

## Hierarchical clustering

```
## clusteringOutput: partition table
##
## 1 2 3 4
## 4 4 4 4
## The call that created this object was:
## MLearn(formula = ~., data = t(dunkley2006), .method = hclustI(distFun = dist,
```

plot(hcl, exprs(t(dunkley2006)))

A wide range of classification and clustering algorithms are also available, as described in the ?MLearn documentation page. The pRoloc package also uses MSnSet instances as input and ,while being conceived with the analysis of spatial/organelle proteomics data in mind, is applicable many use cases.

#### Annotation

All the Bioconductor annotation infrastructure, such as biomaRt, GO.db, organism specific annotations, .. are directly relevant to the analysis of proteomics data. A total of 92 ontologies, including some proteomics-centred annotations such as the PSI Mass Spectrometry Ontology, Molecular Interaction (PSI MI 2.5) or Protein Modifications are available through the rols.

```
library("rols")
olsQuery("ESI", "MS")

## MS:1000073 MS:1000162

## "ESI" "HiRes ESI"
```

Data from the Human Protein Atlas is available via the hpar package.

# Other relevant packages/pipelines

- Analysis of post translational modification with isobar.
- Analysis of label-free data from a Synapt G2 (including ion mobility) with synapter.
- Analysis of spatial proteomics data with pRoloc.
- Analysis of MALDI data with the MALDIquant package.
- Access to the Proteomics Standard Initiative Common QUery InterfaCe with the PSICQUIC package.

Additional relevant packages are described in the RforProteomics vignettes.

#### Session information
